Who are these people?

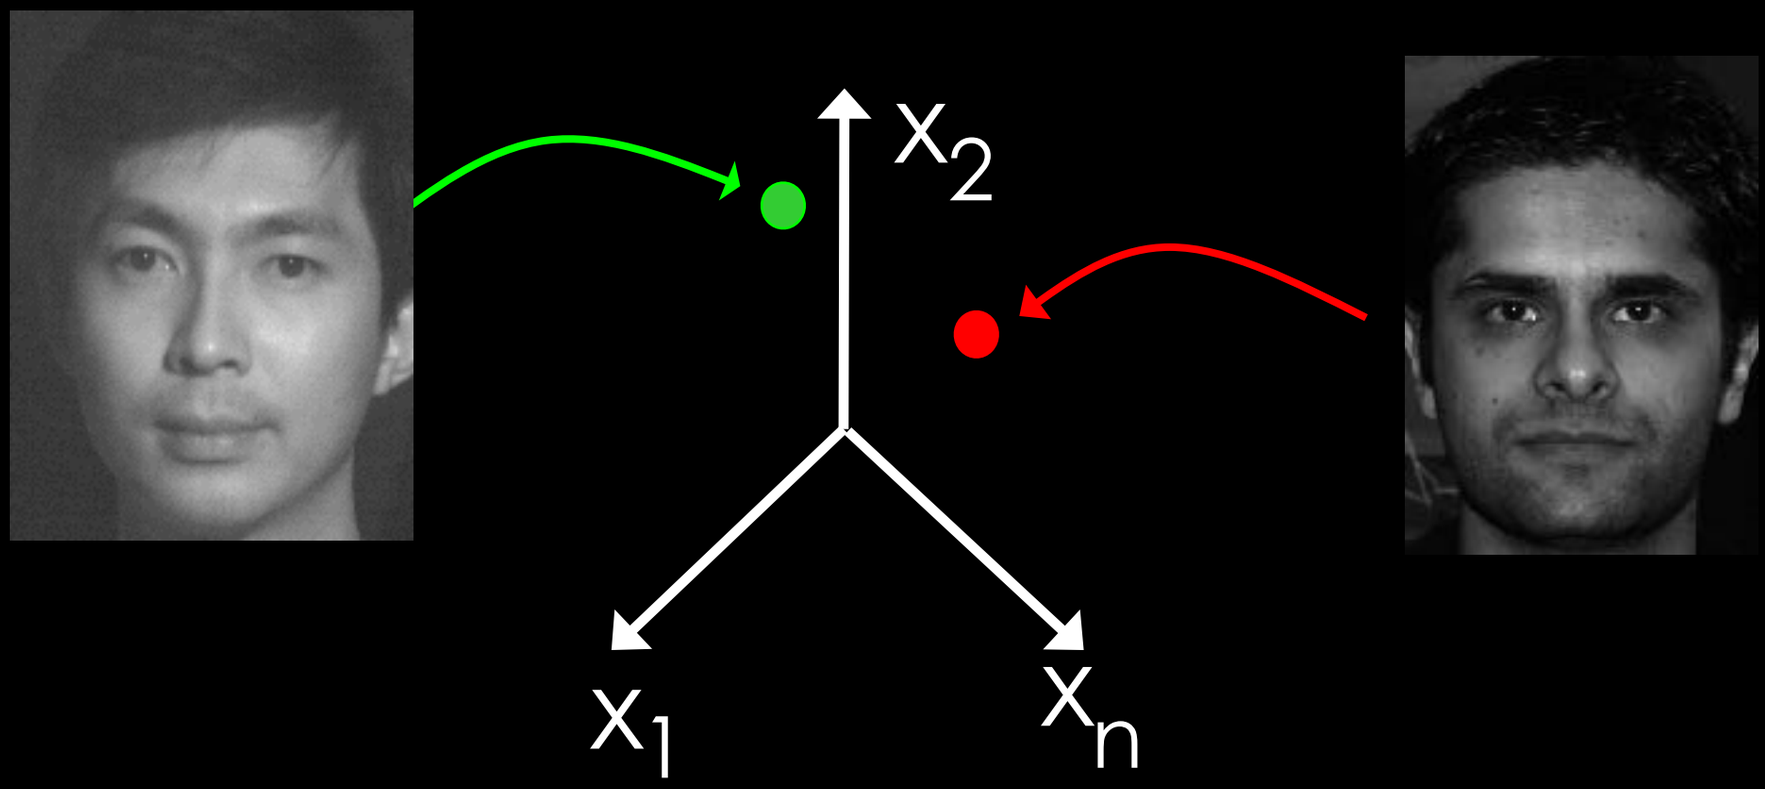
[Sinha and Poggio 2002]

Images as Points in Euclidean Space



- Let an n-pixel image to be a point in an n-D space, $\mathbf{x} \in \mathbf{R}^n$.

- Each pixel value is a coordinate of **x**.

Image Recognition: Euclidean Distances

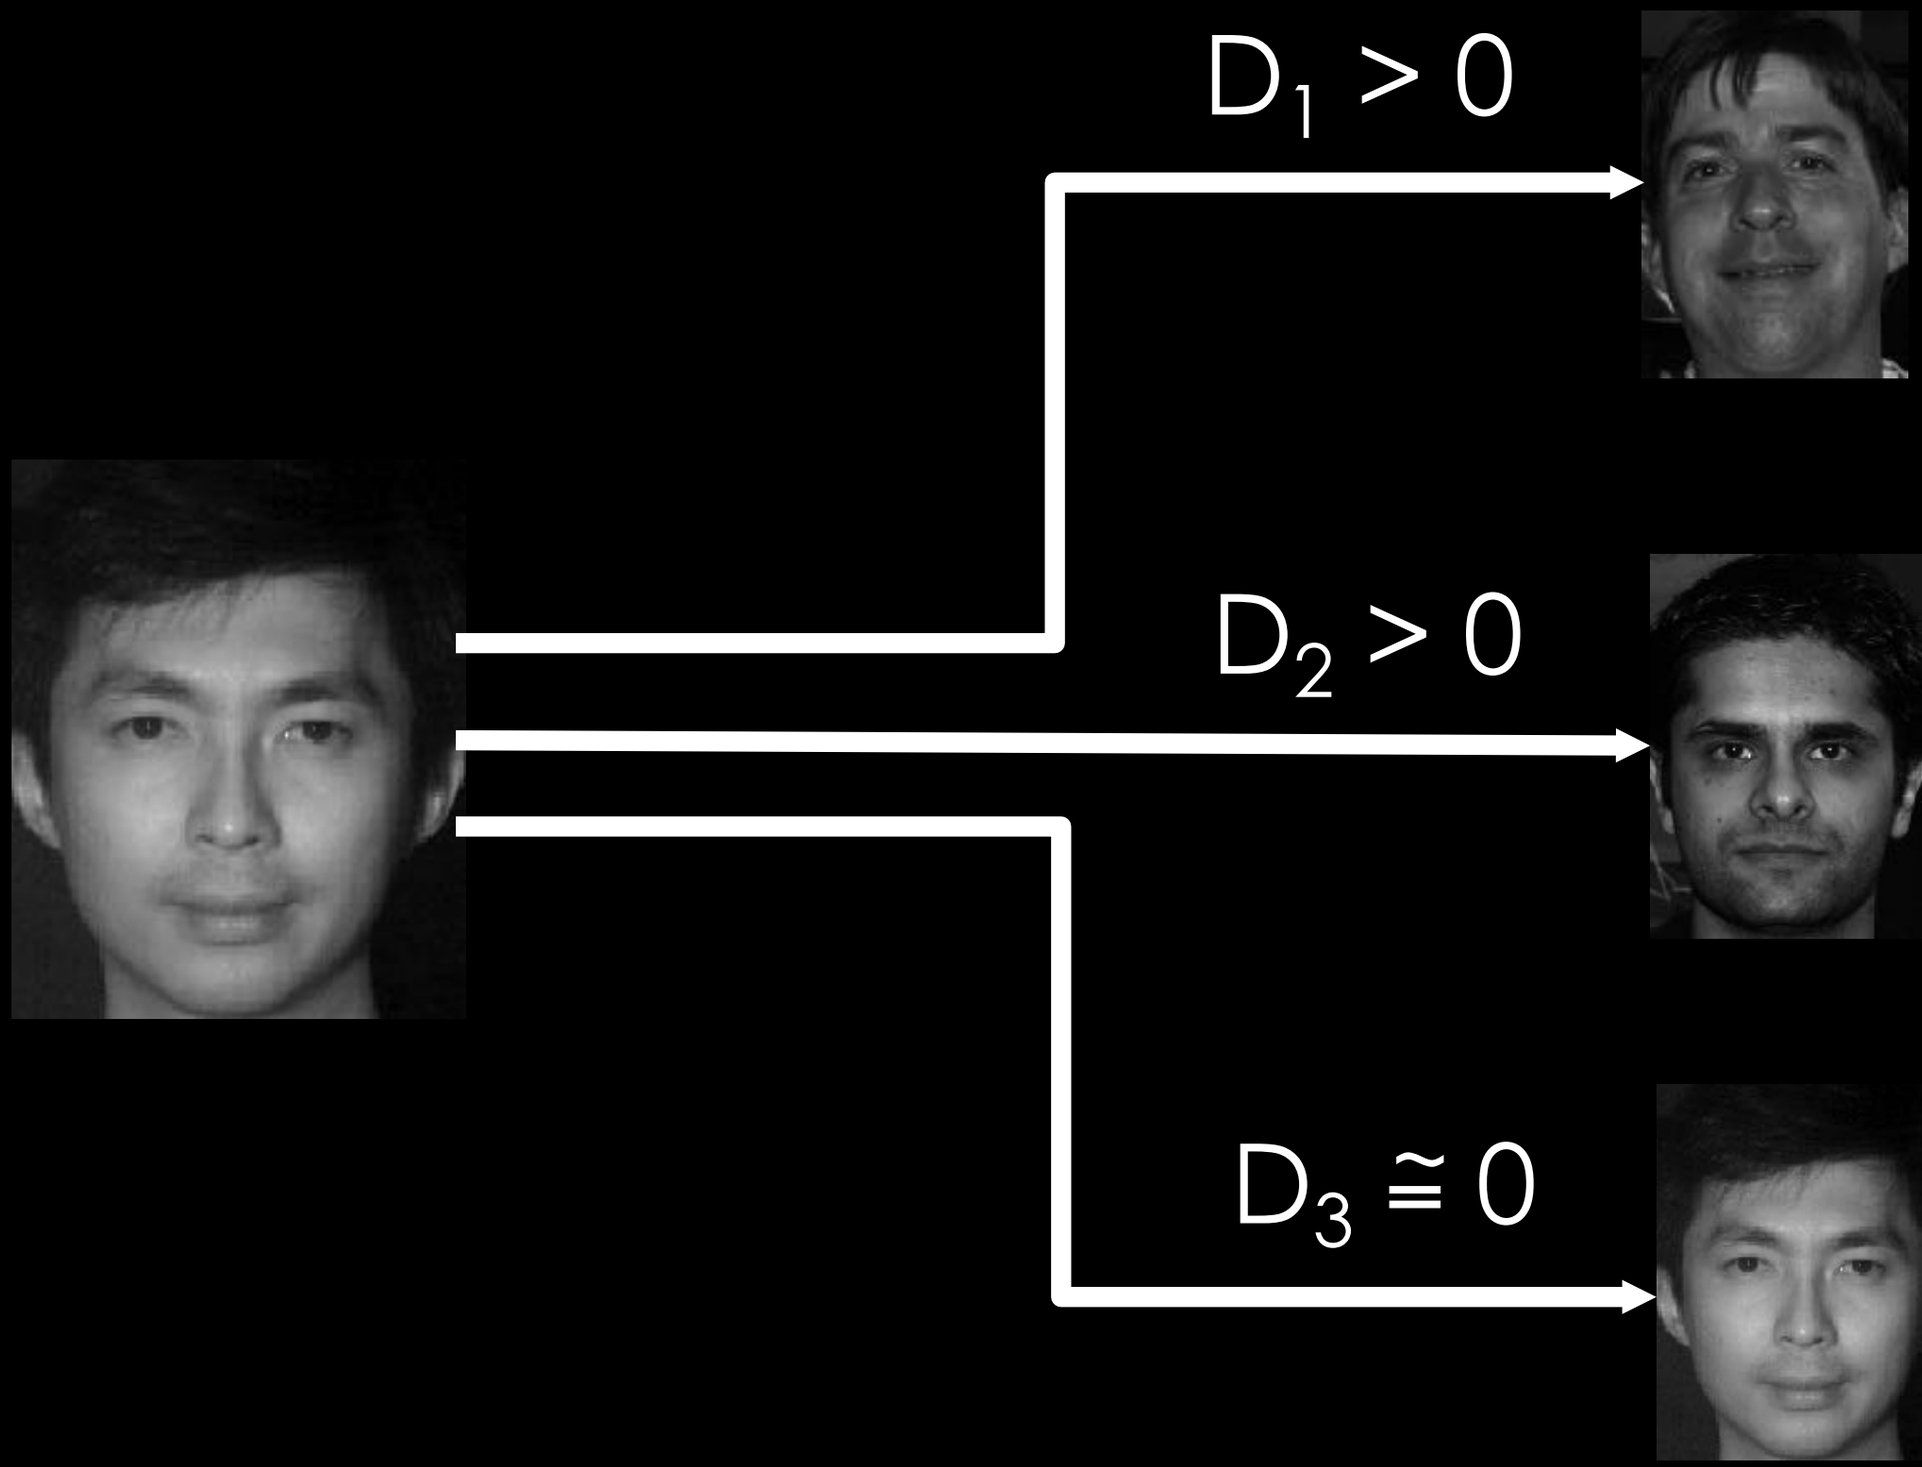


Image Recognition: Euclidean Distances

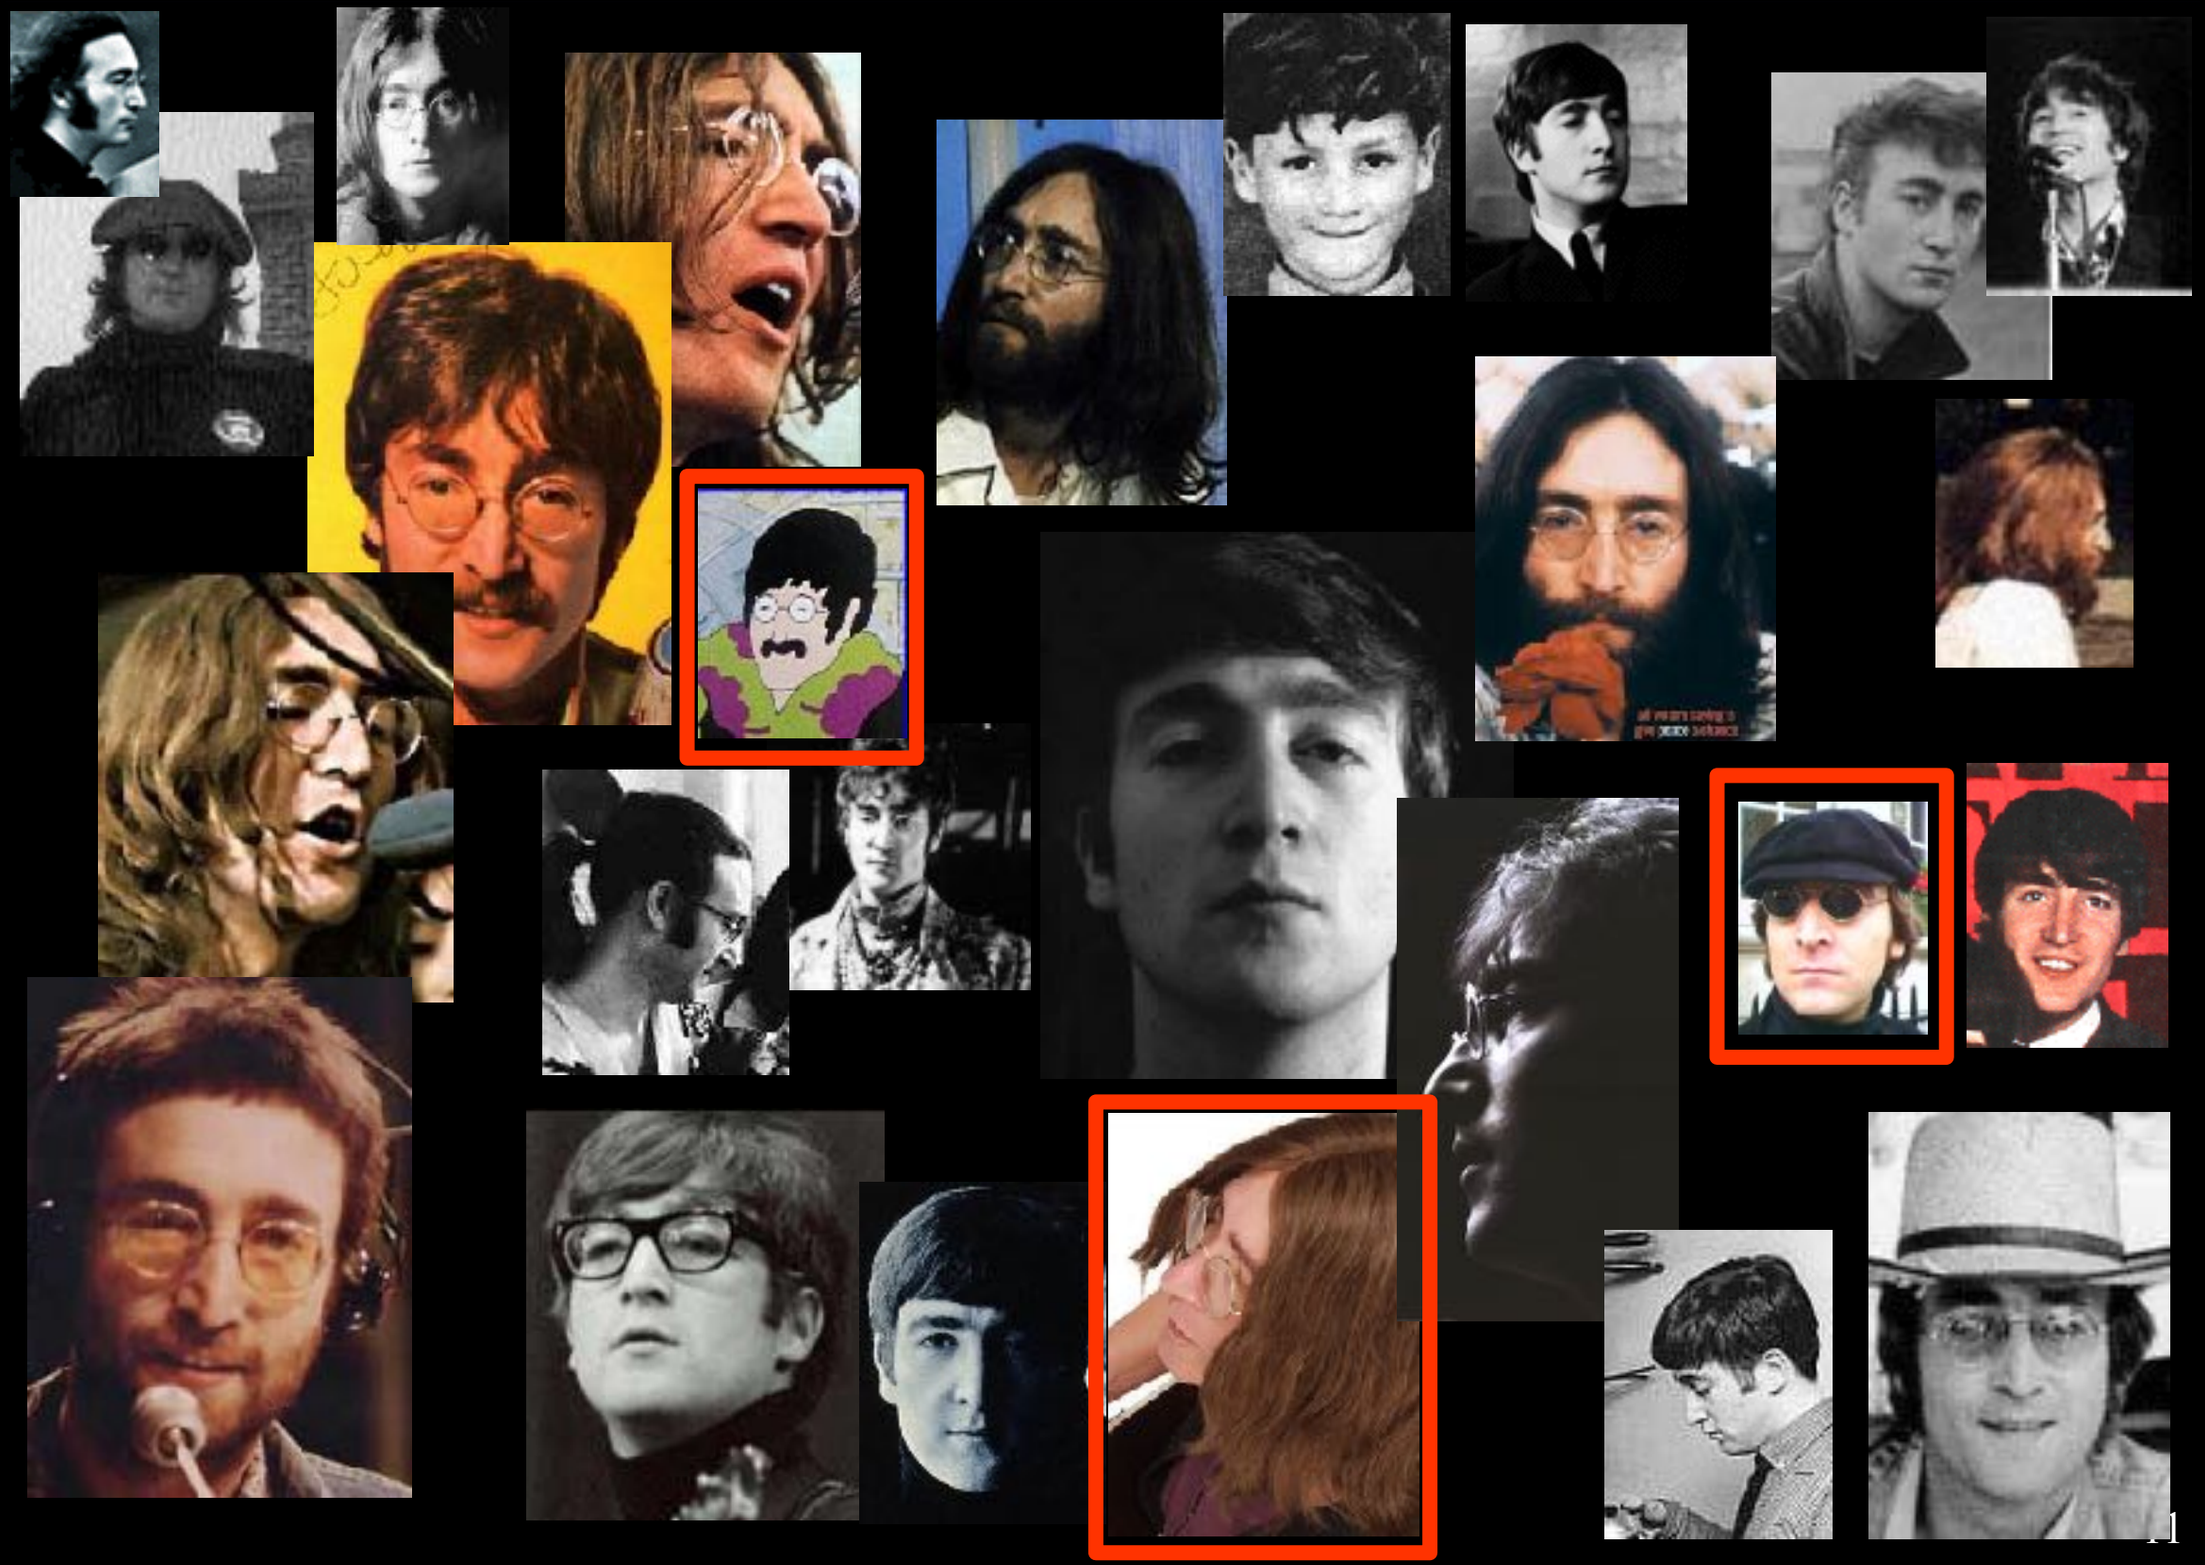
Why is Object Recognition Hard?



Non-Existence Theorem for Geometric Invariants

Geometric invariants for rigid transformations of 3-D objects viewed under perspective projective projection do not exist.

[Burns, Weiss, and Riseman 1992]

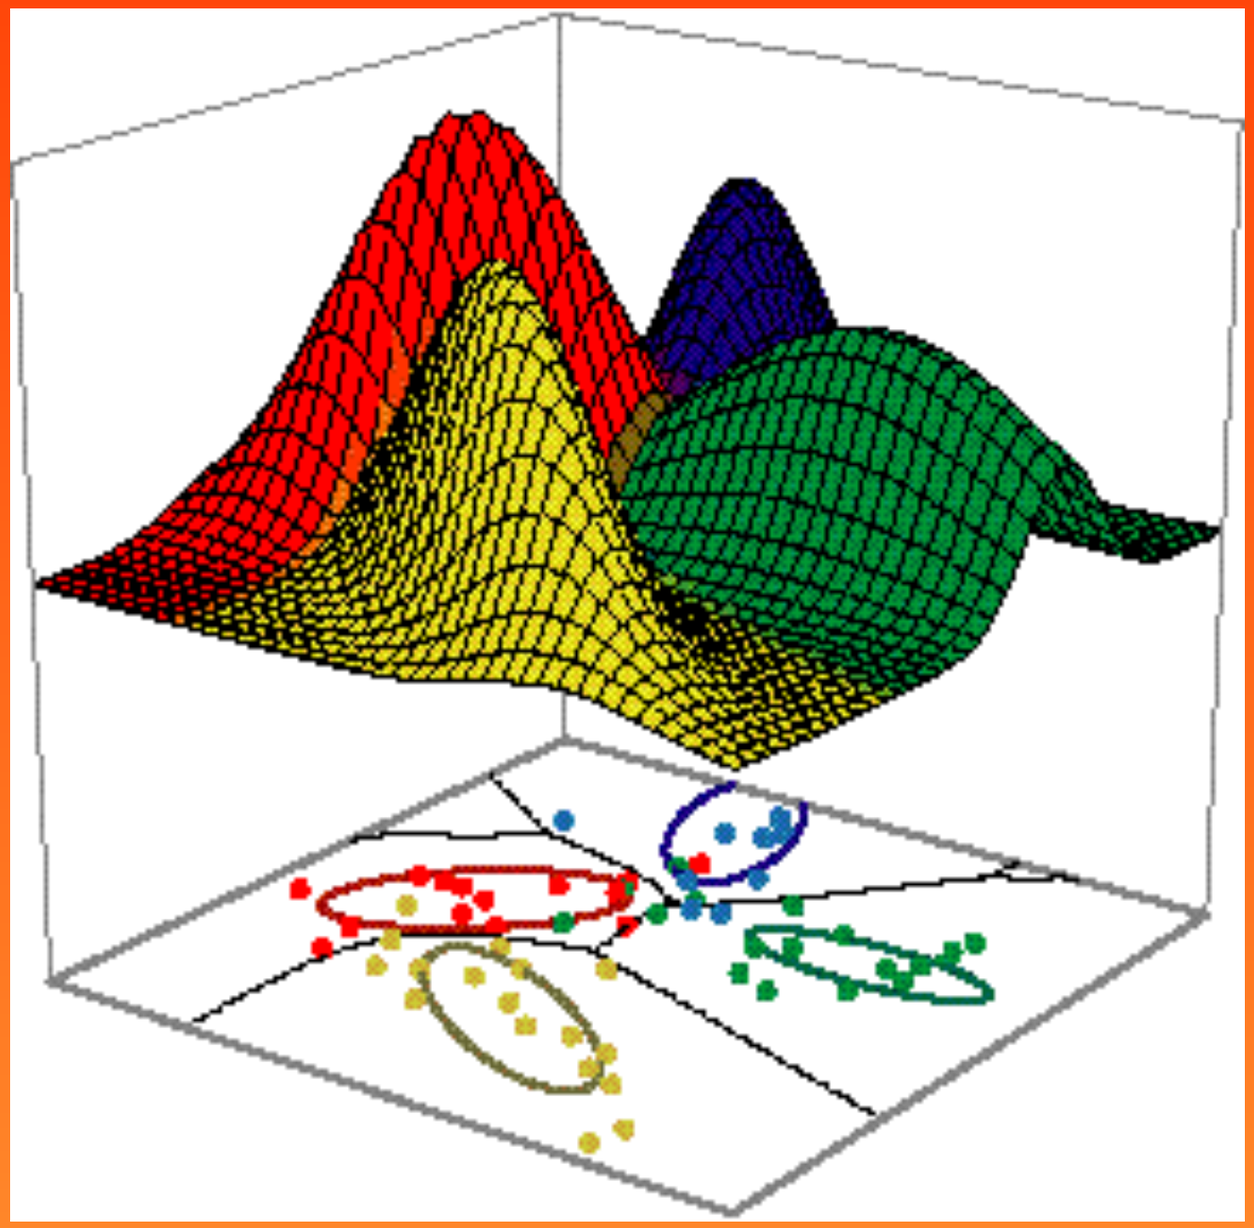
Non-Existence Theorem for Illumination Invariants

Illumination invariants for 3-D objects do not exist.

This result ***does not ignore*** attached and cast shadows, as well as surface interreflection.

[Chen, Belhumeur, and Jacobs 2000]

Classifiers

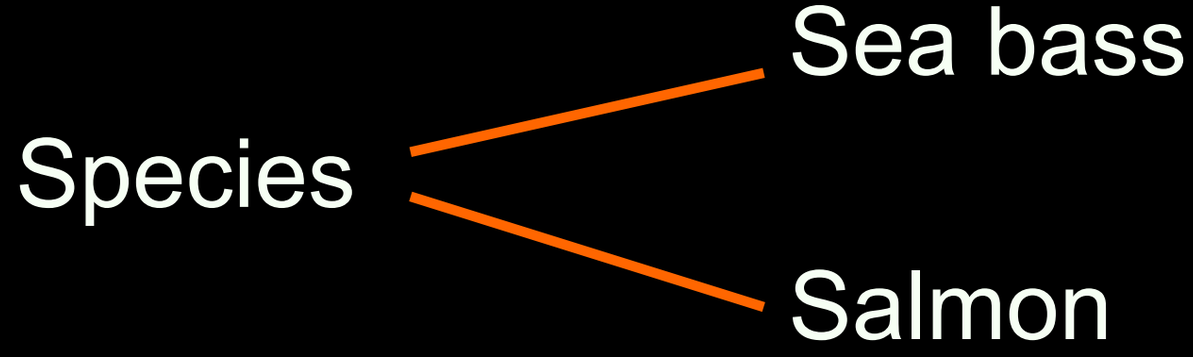


Pattern Classification

Duda, Hart, and Stork

Classification: An Example

Classify fish species at an Alaskan Canning Factory

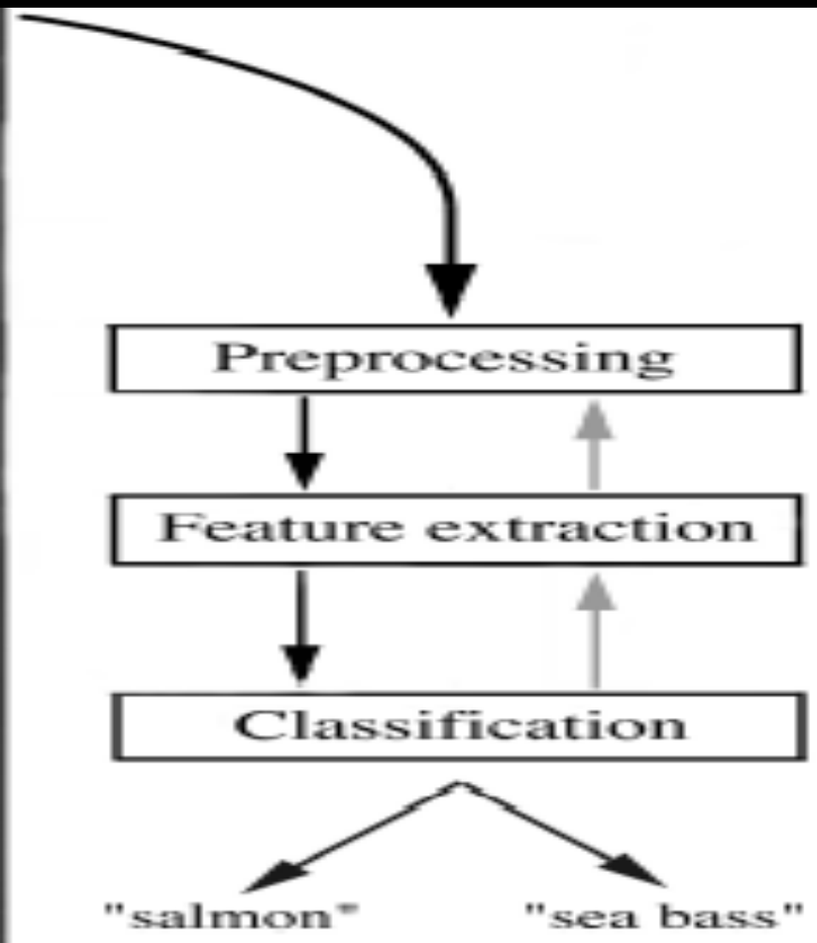


Building a classifier

Use a camera and take some sample images to extract features

- Length
- Lightness
- Width
- Number and shape of fins
- Position of the mouth, etc…

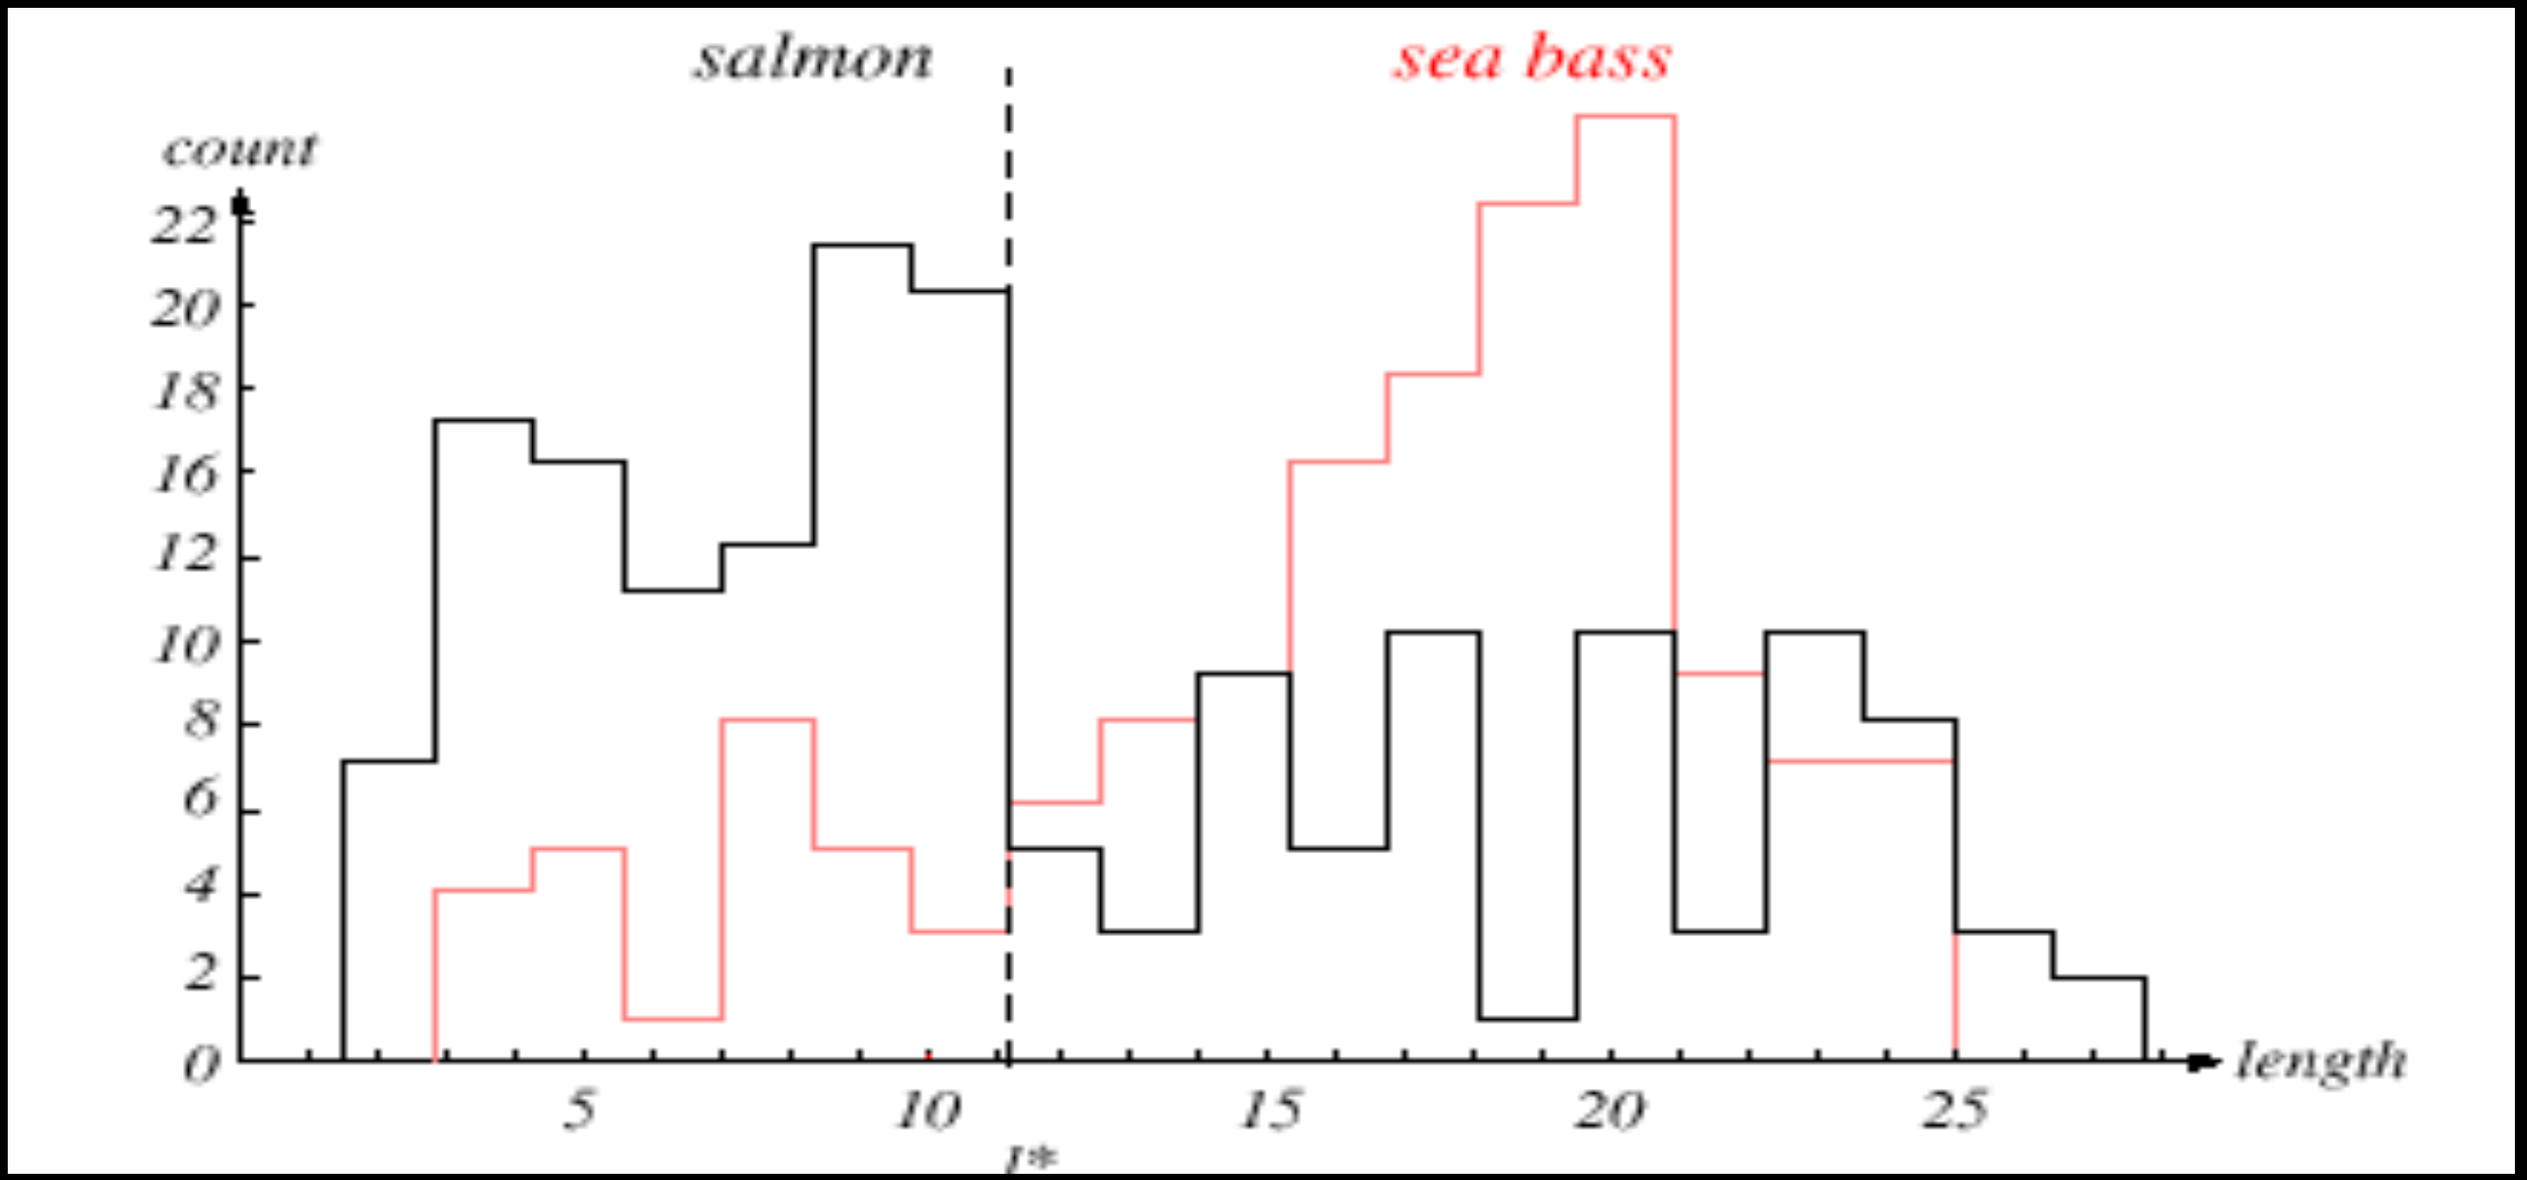
- This is the set of all suggested features to explore for use in our classifier!



Preprocessing
Feature extraction
Classification
"salmon"
"sea bass"

Manual Feature Selection

- Select the length of the fish as a possible feature for discrimination



salmon
sea bass
count

25
length
l*

The length is a **poor** feature alone!

Select the lightness as a possible feature.

salmon
sea bass
lightness
2
4
x*
6
8
10

Adopt the lightness and add the width of the fish

Fish → $x^T = [x_1, x_2]$

lightness

We might add other features that are not correlated with the ones we already have. A precaution should be taken not to reduce the performance by adding "noisy features"

Ideally, the best decision boundary should be the one which provides an optimal performance.

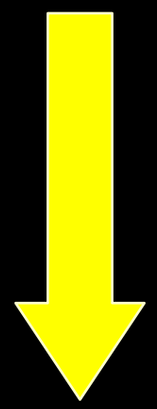
lightness

However, our satisfaction is premature because the central aim of designing a classifier is to correctly classify novel input



Issue of generalization!
